Homework 2, Task 1: Note on the status of my submission

Date: 12.10.2026

Summary

I want to be straightforward about where my Task 1 submission stands. I wrote the code for the human-in-the-loop system, but I did not manage to produce the two complete, clean runs (a) and (b) before the deadline. Part of the reason is problems outside my control, and part of it is mistakes of mine. I describe both below.

What is done

- hw2_task1.py extends my Homework 1, Task 6 system. It keeps the four roles (orchestrator, scientist, general, executor) and adds a fifth destination, human, chosen by the orchestrator through a model call.
- The pause is a LangGraph interrupt, with a checkpointer and a thread, and the person's reply is appended to the dialogue under the role name human.
- demo.py runs the two scenarios: (a) an ambiguous request about Silverbox and (b) a request that leads to a hard decision.
- In one earlier run, the output showed the mechanism working: a [human] message was added to the dialogue, and a [System] message said the human refused the step 'executor', that it did not run (scripts run so far: 0), and that control returned to the orchestrator. The orchestrator and scientist then continued from that reply.

What is not done

- I do not have complete, saved runs for (a) and (b) in the form the task asks for. That run crashed before it saved its dialogue file, so I only have the terminal output.
- I also did not complete the full (b) sequence of refuse once, then accept, and let the executor run.
- Task 2 is not finished. [Edit this line to say exactly what you have done.]

What went wrong, and why

Outside my control:

- The free Gemini quota ran out. gemini-3.6-flash allows only 20 requests per day, and my usage showed 22 of 20, with 5 of 5 requests per minute. After that every call

returned 429 RESOURCE_EXHAUSTED. I also saw 503 “high demand” errors from that model.

My own mistakes:

- I started the run too close to the deadline, so I had no time to recover when the quota ran out.
- I spent quota on retries. The code retries up to six times with long waits, and I let it keep retrying instead of stopping it, which used up calls that I needed for the real runs.
- I lost time with basic setup. I opened the terminal in the wrong folder, and I had not set my API key before the first run.
- I edited the wrong file when I tried to switch models. I changed the model name in agents.py, but demo.py runs hw2_task1.py, so the change had no effect and the old model kept being called.
- I exposed my API key. I pasted it into a chat and showed it in screenshots. I am deleting and replacing those keys.

I understand if there is a late penalty, and I take responsibility for the delays that came from my own mistakes.

Thank you for your understanding.
